Individual Report

Our team created an application that could allow developer to work in a file code at the same time over the network. We tried to mirror a Google Docs type of workflow, adding the code editor options.

The application runs as intended and is integrated as close as possible to our initial proposal. We had to make small rearrangements due to some time constraints, but also we implemented a feature learned in class, which is the chat room.

This application can very usefull for quite a lot of programmers, although there are many programming environments and online editors, this code editor can be an addition to the toolbox for online cooperation.

For this project I have helped develop some user interface at the front end, engaged in discussion of ideas for user GUI designed, as well as co-wrote our final report for our project.
